

Consider this possibility of **Time** and **Space**:

October 13, 2007

What if Milo Wolff is correct and this is a frequency universe?

What if we are like a superheterodyne receiver and all this **Time** and **Space** are both really made up of nothing but frequencies?

What if smaller is really higher frequencies and larger is really lower frequencies?

Then Dr. Milo Wolff must be right about this all frequency universe.

Extra space, even in the micro world, can be construed as force, as it is in **General Relativity**. The tensor math only has tensors for space in GR. No tensors exist for force in GR. Extra space becomes force in GR.

In GR **more** space (than average) between two entities can be construed as a **repulsive** force between these two entities. **Less** space (than average) between two entities is the same as an

attractive force between these two entities.

Once you see this, you must realize the micro and macro worlds are similar.

Then you also see the electron spin frequency that creates this force in magnetism and sigma and pi chemical bondings must also not only be producing the smallest units of magnetism but they must also be producing the smallest quanta of space as well.

Milo Wolff has proven the electron is a **scalar** standing wave.

Therefore: the **spin** frequencies of these **scalar** standing wave entities are producing **Space**.

And the **scalar** frequencies themselves are producing **Time**.

Now we must look at Gabriel Lafreniere's phase shift:

(Click link below)

http://www.glafreniere.com/sa_phaseshift.htm

Once this important phase shift is realized then one can unify the forces by stating: More **Time** between any two scalar wave entities is

proportional as to how much more out of phase these two principal **scalar** frequencies are to each other.

More **Space** between two scalar wave entities is proportional as to how much more out of phase these **spin** frequencies are to each other.

This is why we see these things seemingly obeying *Ampere's Laws*.

Quarks are merely higher scalar frequencies than electrons and galaxies are much lower scalar frequencies.

More scalar wave similar frequencies between any two scalar wave entities will place both the principal scalar frequencies and the spin frequencies more out of phase so this will mean more space and more time will also exist between these scalar wave entities.

And this is exactly what we find we have here in our enigmatic universe, isn't it?

Because stars that are further away from us in space are also further from us in time as well.

And space-time becomes truly 4-dimensional:
